Refinery

SRU Refractory Installation

Description: For this project, JTT was awarded work to supply and install refractory material in a new SRU Train in the refinery. JTT designed the reaction furnace, sandblasted for surface preparation, and installed gunite and brick in the unit.

Highlight: JTT performed sandblasting and refractory installation in the SRU. While completing the job, JTT discovered issues with the anchoring system, refractory designs, pre-installed coatings and pre-installed materials. The plant was very pleased with JTT's recommendations and performance.
